

Ionic Bonding and Formula Units

Checkpoint Answer Sheet

Student name: _____ Date: _____

Complete independently

Show every charge and ratio. Submit only this completed sheet in U3 L2 Checkpoint Submission.

1. Ion formation

Calcium loses two electrons and fluorine gains one electron. State each ion and explain how its charge forms.

2. Formula unit

Use Ca^{2+} and F^- to complete the model and charge check.

Cation	Anion	Ratio	Positive charge	Negative charge	Formula
Ca^{2+}	F^-				

3. Lattice model

Draw a small repeating model with at least two Ca^{2+} ions and four F^- ions. Label the ions and show that opposite charges are nearest neighbors.

Labeled repeating ionic arrangement

4. Reasoning

Explain why CaF_2 is electrically neutral and why its formula does not represent one separate molecule.
